

Annex 1 - Trends in residual waste tonnages at CRCs

Tonnages of residual waste accepted at the CRCs for the period January to October 2021 are shown in **Table 1** below.

There does not appear to be any increase in tonnages because of introducing the residual waste arrangements at the 'recycling only' sites. Interestingly the highest monthly total of residual waste for the year to date was in March, the month preceding the reintroduction of residual waste at these sites. The amounts of residual waste at the 'recycling only' sites have remained at a relatively constant level since April 2021 and certainly do not suggest a pattern of growth.

The amounts of residual waste collected at each of the CRCs between April and October 2021 is shown in **Figure 1** below. This shows that the four small CRCs dealt with significantly less residual waste than the other larger CRCs. Collectively these four sites managed only 4% of the residual waste collected during this period.
